Glossary of Main Terms

Term or Acronym	General Meaning Of Term
EU	European Union
EC	European Commission
FSAS	Food Standards Agency in Scotland
WHO	World Health Organisation
PAHs	Polycyclic aromatic hydrocarbons
PAH 4 Sum	Sum of 4 PAHs (benzo[a]pyrene, benz[a]anthracene, benzo[b]fluoranthene, chrysene)
PCB	Polychlorinated biphenyl
Ortho-PCB	Ortho-substituted PCB (non planar)
Non-ortho-PCB	Non-ortho-substituted PCB (co-planar)
Dioxins	Collective name for chlorinated Dioxins & Furans
PCDD/F	Polychlorinated dibenzo- <i>p</i> -dioxin/ polychlorinated dibenzofuran
TEF	Toxic Equivalency Factor – toxicity expressed for each dioxin-like compound as a fraction of 2,3,7,8-TCDD (2,3,7,8-TCDD = 1).
TEQ	Toxic Equivalence – product of the congener concentration and the TEF
Total TEQ	Total of the Sum of all the Toxic Equivalences (TEQs) for each group of compounds
Sum of ICES 6	Sum of PCB28, PCB52, PCB101, PCB138, PCB153 and PCB180
fat weight	Values relevant to the assessed fat content of the sample
whole weight	Values based on the sample as received 'whole' or wet
WHO-TEQ 2005	World Health Organisation - TEQ based on values as set in 2005
LOD	Limit of Detection
LOQ	Limit of Quantification
Lower bound	assumes values at less than the limit of detection are zero (e.g.<0.01=0)
Upper bound	assumes values at less than the limit of detection are equal to the limit of detection (e.g. <0.07=0.07)
Trace Element	An element in a sample that has an average concentration of less than 100 parts per million (less than 100 mg/kg)
Heavy Metals	A loosely defined subset of elements that exhibit metallic properties (some are toxic, some are a nutritional requirement in small amounts), (This survey includes, Cr, Mn, Co, Ni, Cu, Zn, As, Se, Ag, Cd, Hg & Pb, (Chromium, manganese, cobalt, nickel, copper, zinc, arsenic, selenium, silver, cadmium, mercury and lead)
ng/kg	Nanogram per kilogram (x10 ⁻⁹ / part per trillion)
µg/kg	Microgram per kilogram (x 10 ⁻⁶ / part per billion)
mg/kg	Milligram per kilogram (x 10 ⁻³ / part per million)
ICP-MS	Inductively coupled plasma-mass spectrometry
HRGC-HRMS	High resolution gas chromatography - high resolution mass spectrometry
HRGC-LRMS	High resolution gas chromatography – unit resolution mass spectrometry

Executive Summary

This study on chemical contaminants in shellfish from Scottish classified shellfish production areas, fulfils part of the requirements of EU member states (EU Regulations (EC) No.1881/2006 and (EC) No. 854/2004) to adopt appropriate monitoring measures and carry out compliance checks on shellfish produced for human consumption. In comparison to earlier years, the scope of this study was widened to include production areas that had not been tested before. Marine shellfish bio-accumulate environmental contaminants because of their inability to metabolise these during feeding. The study determines concentrations of regulated environmental contaminants in the flesh of edible species with a view to determine current levels of occurrence and to allow estimation of consumer exposure.

The study analysed 56 composite samples of shellfish including mussels, Pacific oysters, cockles, native oysters, queen scallop, razor clams, wedge clams and surf clams, for polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/Fs, dioxins), polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs) and heavy metals. The methodologies used for the analyses were UKAS accredited to the ISO 17025 standard and follow EU commission regulations for data quality criteria.

The highest observed levels of the currently regulated PAHs, benzo[a]pyrene at 5.6 µg/kg, and PAH 4 at 23.3 µg/kg compare to the maximum permitted level (MPL) of 5 µg/kg and 30 µg/kg respectively (Regulation (EC) No. 835/2011). Subsequent re-sampling at the same site at which this benzo[a]pyrene level was observed, returned benzo[a]pyrene and PAH 4 values of 2.6 µg/kg and 12.4 µg/kg, respectively for the same species of shellfish. In the case of PCDD/Fs and PCBs in particular, contaminant concentrations were all below the regulatory maximum levels (Regulation (EU) No. 1259/2011), and this level of occurrence is unlikely to pose a risk to public health. Similarly, the concentrations of the regulated heavy metals, mercury, cadmium and lead which showed a maximum value of 0.77 mg/kg, for lead, were below the set maximum limits (1.5 mg/kg for lead - Commission Regulation (EC) No. 1881/2006 as amended). Although the contaminant profiles from the current study are similar to the previous year's data, there is some elevation of concentrations observed for some of the contaminants (in particular for PAHs, but for PCDD/Fs and PCBs as well). This may be attributable to the wider range of sites monitored, or the period of sampling, in the current year's study

The data contained in this report has also been issued as individual test reports for each of the relevant shellfish producing area local authorities.

1. Study Background

Marine shellfish are an excellent source of protein, are high in essential minerals, and low in calories and fat. In many parts of the UK and in Scotland in particular, the shellfish industry makes a significant contribution to the local economy. Shellfish have a recognised potential for bio-accumulating contaminants and some bivalve species such as mussels, are commonly used as early indicators of local pollution. Bivalves feed by filtering plankton from the surrounding water that washes through their habitat. This feeding mechanism leads to the bio-accumulation of pollutants of biogenic and anthropogenic origin such as polychlorinated dibenzo-p-dioxins (PCDDs), polychlorinated dibenzofurans (PCDFs), polychlorinated biphenyls (PCBs), heavy metals (trace elements) and polycyclic aromatic hydrocarbons (PAHs), from the surrounding waters. The bio-accumulation potential of the shellfish species used for food is particularly relevant in the case of environmental contaminants with long half-lives such as chlorinated dioxins and PCBs. These contaminants have been the subject of a number of studies (Garraud et al 2007, Lee et al 2007, Fernandes et al 2009, Fernandes et al 2012) relating to the occurrence and bio-accumulation in marine species and the resulting potential for human exposure arising from the consumption of the edible species.

In recognising the requirements of food safety, the EU has for a number of years, defined regulation for the control of these contaminants in a range of foods including shellfish. (Commission Regulation (EC) No 1259/2011, Commission Regulation (EU) No 835/2011, Commission Regulation (EC) No 333/2007). Some of the regulations specify new requirements on the controls expected by the competent authority (Food Standards Agency) with respect to classified shellfish production areas. EU member states are required to adopt appropriate monitoring measures and carry out compliance checks with regard to the occurrence of these contaminants in shellfish produced for human consumption.

PCDD/Fs and PCBs are recognised environmental and food contaminants that are known to bio-accumulate in fish and shellfish. The extent of this accumulation is evident by the levels of these contaminants detected in various studies. In the UK, Total Diet Studies (TDS) (FSA 2003) carried out over the last 2 decades, fish (including shellfish) has consistently been one of the highest dioxin and PCB containing food groups. Human dietary exposure can therefore be significantly influenced by the fish and shellfish component of the diet, particularly in high level consumers and low body-weight individuals.

Although metabolised in many fish species, PAHs persist in shellfish as filter feeding species appear unable to effect bio-transformation of these contaminants. Other than this bio-accumulation pathway, PAHs can also arise in fish and shellfish through some food preparation and processing methods – e.g. smoked fish are known to contain elevated levels of PAHs. Some PAH compounds have been shown to be genotoxic and carcinogenic, the most studied of which (benzo[a]pyrene, or B[a]P) is regulated in a range of foods including shellfish, within the EU (SCF Opinion 2002, Commission Regulation (EC) No. 208/2005). However, more recent evaluation by EFSA's CONTAM panel, concluded that a set of 4 compounds, namely benzo[a]pyrene, chrysene, benz[a]anthracene and benzo[b]fluoranthene (collectively referred to as PAH4) were more suitable indicators of PAH toxicity in food (EFSA, 2008). These four compounds were subsequently included in the updated Commission Regulation (EC) No. 835/2011, which came into force from September 2012. In a study on bivalve molluscs including mussels, oysters and scallops, the FSA reported positive detection of most PAH compounds in samples taken in England and Wales (FSA 2005). However in comparison to a study carried out about a decade earlier, reported levels were significantly lower and no sample showed levels above the 5 µg/kg EU limit for B[a]P in shellfish.

Some trace elements and in particular, heavy metals are established toxic contaminants. Some elements, such as copper, chromium, selenium and zinc are essential to health but may be toxic at high levels of exposure. Metals and other elements may enter marine and aquatic environments and bio-accumulate in species at any point during growth and harvesting. Some potentially toxic elements occur naturally as part of the local geology, but others may also be found in the location of certain industries, as a result of unauthorised discharge, or as a result of other anthropogenic activity.

As part of its monitoring requirements in support of EU regulations, the FSA in Scotland has overseen the collection of shellfish each year, from classified shellfish production sites within relevant local authority areas in Scotland. In comparison to previous years, the present study has been extended to sites that were not included in earlier chemical contaminant testing. The production sites are required to monitor shellfish samples, with the edible tissues analysed for the contaminants described above, as specified in Commission Regulation (EU) No. 252/2012. The analysis is carried out at the Food and Environment Research Agency (FERA) in York.

FERA is an executive agency of the UK Government's Department for Environment, Food and Rural affairs (DEFRA). In the current context, FERA has generated environmental contaminant data to FSA Scotland, on shellfish collected from new and existing shellfish sites since 2007. This report collates the results of the individual analyses for dioxins, PAHs and heavy metals in samples of shellfish collected from Scottish sites in the first quarter of 2013.

2. Methodology

2.1 Sample Collection and Preparation

56 samples (individual subsamples from each site were composited) of shellfish, including species such as common mussels, Pacific oysters, common cockles, surf clams, queen scallop, wedge clams, native oysters and razor clams were collected during January to March 2013. The sampling period was timed to coincide with the period of optimal contaminant concentrations in the shellfish. A single sample of wedge clams was re-sampled in early July 2013, as a follow-up to the sample collected in mid-February.

Details on the locations, with descriptions of the samples and identification are given in Table 1. The broad geographical distribution of Scottish shellfish production areas is given in Figure 1.

On receipt at the laboratory each sample was given a unique laboratory reference number and the sample details were logged into a database. The samples were stored frozen prior to analysis. Sample preparation consisted of shelling followed by compositing of individual sub-samples. The composites were thoroughly homogenised and aliquots taken for PAH and heavy metal analysis, prior to freeze-drying. Freeze-dried sample powders were re-homogenised and aliquots used for dioxin and PCB analysis.

2.2 Contaminants measured – Specific Analytes

The following analytes were determined: Regulated contaminants are highlighted in **bold**.

Dioxins - all 17, 2378-Cl substituted PCDDs and PCDFs.

Dioxin-like PCBs - IUPAC no. 77, 81, 105, 114, 118, 123, 126, 156, 157, 167, 169 and 189.

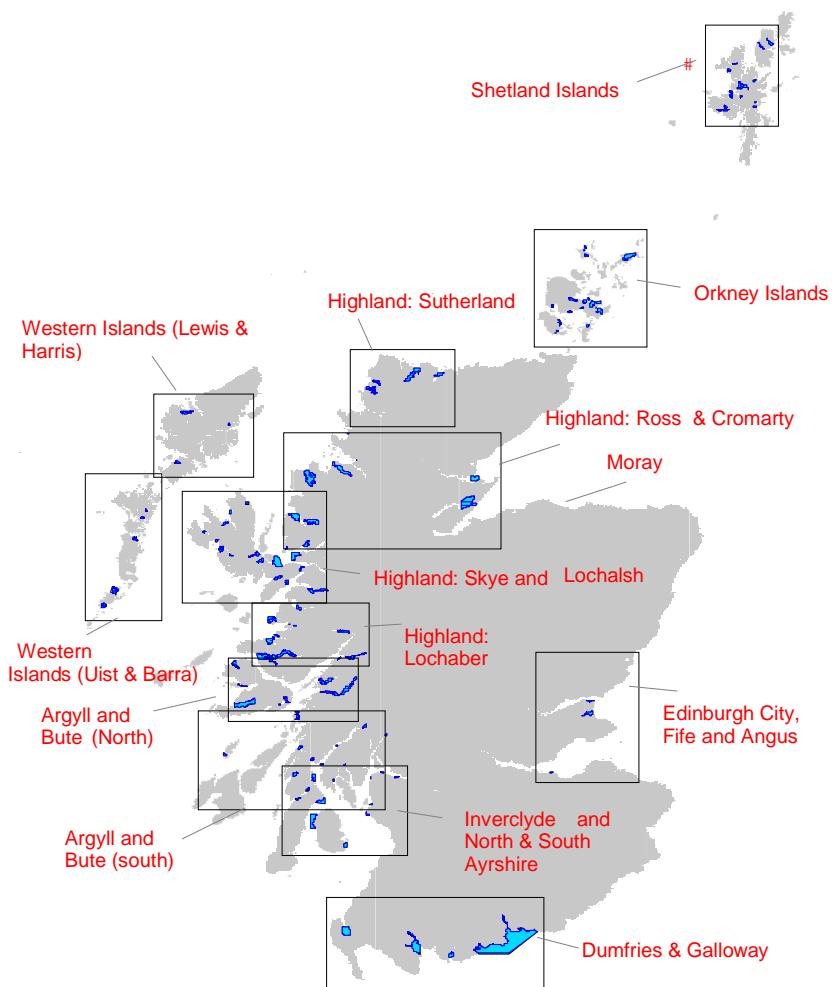

Non Dioxin-like PCBs - IUPAC numbers 18, **28**, 31, 47, 49, 51, **52**, 99, **101**, 128, **138**, **153** and **180**.

PAHs -

acenaphthene, acenaphthylene, fluorene, phenanthrene, anthracene, fluoranthene, benzo[c]fluorene, pyrene, benzo[e]pyrene, benzo[b]naphtho[2,1-d]thiophene, anthanthrene, coronene, benzo[ghi]fluoranthene, **benz[a]anthracene**, **chrysene**, **benzo[b]fluoranthene**, benzo[j]fluoranthene, benzo[k]fluoranthene, **benzo[a]pyrene**, cyclopenta[c,d]pyrene, indeno[123cd]pyrene, dibenzo[ah]anthracene, benzo[ghi]perylene, dibenzo[al]pyrene, dibenzo[ae]pyrene, dibenzo[ai]pyrene, dibenzo[ah]pyrene and the substituted PAH, 5-methylchrysene.

Heavy Metals – Chromium (Cr), Manganese (Mn), Cobalt (Co), Nickel (Ni), Copper (Cu), Zinc (Zn), Arsenic (As), Selenium (Se), Silver (Ag), **Cadmium (Cd)**, **Mercury (Hg)**, **Lead (Pb)**

Figure 1: Shellfish Production Areas that have been monitored since 2006
(Additional sites were tested in 2013)

2.3 PCDD/F and PCB - Analytical Methodology

(FERA (UK NRL) SOPs FSG 453-460)

The method used for the preparation, extraction and analysis of samples has been reported previously (Fernandes et al 2004) and is part of the CEN EN16215:2012 standard. In brief, samples were fortified with ¹³C-labelled analogues of target compounds and exhaustively extracted using mixed organic solvents. Ortho substituted PCBs were separated from non-ortho substituted PCBs and PCDD/Fs by fractionation on activated carbon. The two fractions were further purified using adsorption chromatography on alumina. Analytical measurement was carried out using high resolution gas chromatography-high resolution mass spectrometry (HRGC-HRMS) for the seventeen, 2,3,7,8-Cl substituted PCDD/F congeners and non-ortho substituted PCBs. HRGC-unit resolution mass spectrometry (HRGC-LRMS) was used for the measurement of the ortho substituted PCBs.

All analyses were UKAS accredited to ISO 17025 standards, with the inclusion of reference material and method blanks which were evaluated prior to reporting. Further quality assurance measures included the successful participation in international inter-comparison exercises such as Dioxins in Food-2011 and Dioxins in Food-2012, on dioxins and dioxin-like PCBs. Quality control evaluation for the accompanying data follows the criteria specified for chlorinated dioxins and PCBs (Commission Regulation (EU) No 252/2012). In addition, as NRL for chemical contaminants, FERA participates in PT exercises and other inter-laboratory exercises as organised by the EU-RL.

2.4 Polycyclic Aromatic Hydrocarbons (PAH) - Analytical Methodology

(FERA (UK NRL) SOP FSG 410)

The analytical methodology for the PAHs has been reported before (Rose et al, 2007) and is based on internal standardisation with GC-MS measurement. An aliquot of the homogenised sample was fortified with ¹³C-labelled analogues of target compounds and saponified with methanolic potassium hydroxide. The extracted PAH solutions were purified in two stages with a DMF/cyclohexane partition followed by adsorption chromatography on activated silica. Purified extracts were sensitivity standardised and measured using high resolution gas chromatography-unit resolution mass spectrometry.

The analytical procedure for PAHs is UKAS accredited to the ISO 17025 standard and includes the assessment of method blanks and reference materials, (e.g. T0651, PAHs in palm oil) for compliance with the accreditation criteria. The methodology also meets the criteria required for

evaluating data against the maximum permitted limits for benzo[a]pyrene as specified in EU Commission Regulations. FERA regularly participates in FAPAS PT exercises for PAHs in food. In addition, as NRL for chemical contaminants, FERA participates in PT exercises and other inter-laboratory exercises as organised by the EU-RL.

2.5 Trace Elements - Analytical Methodology

(FERA (UK NRL) SOP FSG 454 and 457)

Aliquots of the homogenised sample were weighed into allotted quartz digestion vessels and a mixture (4:1) of nitric acid and hydrochloric acid added. The vessels were sealed and the contents digested using a high pressure microwave digestion system. Reagent blanks, certified reference materials and a spiked blank were also taken through the procedure. The resulting solutions were transferred to pre-marked acid-clean plastic test tubes and diluted to 10 ml with deionised water. The digest solutions together with a set of standards covering the expected concentration range, were internally standardised with indium or rhodium in dilute nitric acid (1 %v/v). Measurements were made using an Agilent 7500ce ICP-MS with collision cell.

In common with the other two sets of analyses, the analytical procedure is accredited to the ISO17025 standard. The criteria used to assess data included checks on instrument drift, spike recovery, replicate agreement, limits of detection and certified reference material values. Regular, successful participation in FAPAS inter-comparison exercises provides further confidence in the data. In addition, as NRL for chemical contaminants, FERA participates in PT exercises and other inter-laboratory exercises as organised by the EU-RL.

3. Results

Analyte concentrations are presented in Tables 3.1 to 3.6. Concentration units reflect current convention as required by regulation, and data were rounded to two decimal places or as appropriate. The reporting limits (quoted as “<”) for dioxins, PCBs and PAHs are estimated as a dynamic parameter and therefore represent the limits of determination that prevail during the course of the measurement. For PCDD/Fs, PCBs, metals and PAHs, the reporting limits are consistent with the requirements of EU regulations. Data on the reference materials that were analysed concurrently with the samples, were within established acceptable limits, and are available if required.

In addition to the concentration of individual congeners, the dioxin-like toxicity of the samples arising from PCDD/Fs and dioxin-like PCBs has also been reported as a toxic equivalent (WHO-TEQ), which is calculated by multiplying the concentration of each congener of interest by its toxicity equivalency factor (WHO-TEF). The TEQs are presented in terms of the 2005 TEFs (van den Berg et al 2006). Additionally as per the requirements of Regulation 1259/2011, the sum of the ICES-6 PCBs is also provided. The regulations for shellfish are based on whole weight concentrations; however in keeping with previous reports, the results for PCDD/Fs and PCBs have also been reported on a fat weight basis.

PCDD/Fs and PCBs were detected in all the shellfish samples at varying concentrations. The data are broadly consistent with the results of monitoring from previous years (e.g. the average PCDD/F and PCB TEQ at 0.12 ng/kg in 2013 was a little elevated compared to 0.09 ng/kg in 2012), although the maximum value observed (0.32ng TEQ/kg) was almost double the maximum (0.17 ng TEQ/kg) for 2012. Maxima in both years occurred in samples of Pacific oysters. As observed in earlier studies on shellfish in the UK, PCDD/Fs generally made a proportionately greater contribution to the TEQ than the PCBs, apart from a set of samples (mussels and oysters) from Shetland, which showed higher levels of PCB TEQ. This may be indicative of the local contamination profile. As there were different numbers of samples of the individual species, and a limited data set, it would be inappropriate to compare concentrations across the species, but the data indicate lower contamination levels in cockles. For all samples, the detected concentrations were comfortably below the regulatory limits for PCDD/F and dioxin-like PCB TEQ, and the ICES-6 PCBs.

PAHs were detected in all the shellfish analysed. Phenanthrene, fluoranthene, pyrene, benzo(b)fluoranthene and benzo(e)pyrene were generally the compounds that occurred to the greatest extent in the samples studied. Among the toxicologically significant compounds

highlighted by the SCF (SCF 2002), some of the higher molecular weight PAHs (anthanthrene, dibenzopyrenes) were generally not detectable (typically < 0.1 µg/kg). The concentrations of benzo[a]pyrene detected in the samples did not exceed the maximum limits specified in EU regulations (Commission regulation (EC) No. 835/2011), apart from a single sample of wedge clams which showed a concentration of 5.6 µg/kg which was proximate to the maximum limit of 5 µg/kg. A similar sample taken later in the year, from the same site, showed a benzo[a]pyrene concentration of 2.6 µg/kg. The highest concentration of PAH4 detected (23.3 µg/kg for a sample of razor clams), was below the maximum limit of 30 µg/kg. The patterns of occurrence are consistent with the results of monitoring in previous years, but in a manner similar to the PCDD/Fs and PCBs, the current range of occurrence for PAH4 (0.49 – 23.3 µg/kg, mean 4.2 µg/kg) is elevated in comparison to the range observed for the previous year (0.43 – 3.89 µg/kg mean 1.7 µg/kg).

Apart from silver (Ag), which was below the limit of quantitation in some cases, all samples showed the presence of heavy metals. Some metals such as manganese (Mn), zinc (Zn), copper (Cu), and arsenic (As) occurred at higher concentrations, and the oyster samples in particular showed significantly higher concentrations of Cu (maximum value of 12.1 mg/kg) and Zn (maximum value of 607 mg/kg). Apart from the higher concentration of Zn detected in a few samples, the data is consistent with the results of previous years monitoring. The occurrence of the three regulated metals (Commission Regulation EC 1881/2006 as amended by 629/2008) - Mercury (Hg), Cadmium (Cd) and Lead (Pb), were below the regulated maximum limits of 0.5 mg/kg 1.0 mg/kg and 1.5 mg/kg respectively.

In very general terms, the patterns of occurrence across the three classes of contaminants were consistent with those recorded for earlier years. Some contaminants, PCDD/F and PCBs, and in particular, PAHs, do show a comparative elevation in concentrations. This may be due to the larger numbers of samples collected, but may also be due to the period during which sampling was carried out.

4. Conclusions

In general terms the results of the 2013 monitoring for dioxins and PCBs, PAHs and heavy metals, are similar to the previous year's data, with some elevation of concentrations observed, particularly for PAHs and PCDD/Fs and PCBs. This may be attributable to the wider range of sites monitored, or the period of sampling, in the current year's study.

For the majority of samples, the concentrations of regulated contaminants were below the regulatory maximum levels. Some shellfish showed benzo[a]pyrene concentrations that were proximate to the maximum limit of 5 µg/kg, in particular, a single sample of wedge clams.

Further analysis of the data in conjunction with details such as the sampling locations and times, would yield information on the spatial distribution of the contaminants, and may allow further conclusions on the study, but this is outside the scope of the current project.
